## **COPYRIGHT STATEMENT**

The copyright law of the United States (Title 17, United States Code) governs the making of photocopies or other reproductions of copyrighted materials including foreign works under certain conditions. In addition, the United States extends protection to foreign works by means of various international conventions, bilateral agreements, and proclamations.

Under certain conditions specified in the law, libraries and archives are authorized to furnish a photocopy or other reproduction. One of these specified conditions is that the photocopy or reproduction is not to be "used for any purpose other than private study, scholarship, or research." If a user makes a request for, or later uses, a photocopy or reproduction for purposes in excess of "fair use," that user may be liable for copyright infringement.

The Columbia University Libraries reserve the right to refuse to accept a copying order if, in its judgement, fulfillment of the order would involve violation of the copyright law.

## COTTON PRODUCTION IN GEORGIA, 1928 - 1937

- By Counties -

Georgia cotton acreage planted during the past 10 years (1928-1937) has ranged downward from the high acreage of 3,464,000 in 1930 to the low point of 2,164,000 acres in 1934, or a spread of 38 percent from the former figure. Reduction of acreage under the Agricultural Adjustment Administration program largely accounted for the small acreage in 1934, the smallest since 1877. In 1933, when the acreage harvested was almost as low, approximately 697,000 acres were plowed up under the first cotton control program.

Yield of lint cotton per planted acre varied from 146 pounds in 1928 and 151 in 1932 - both years of heavy boll weevil infestation - to 268 pounds in 1937, the record high yield for the State. It is also interesting to note that the 5-year average yield of 237 pounds for the latter half of the 10-year period was 29 percent higher than the average of 184 pounds for the first 5 years.

Production during the 10 years was lowest in 1932 when 853,000 standard bales of 500 pounds gross weight were harvested, and highest in 1930 with 1,592,000 bales. The 5-year average (1928-1932) was 1,241,000 bales compared with 1,143,000 bales for the following 5-year period 1933-1937, when the crop control programs were in force.

It was usually the case that acreage, yield and production varied in the various counties correspondingly with State changes, although there were some exceptions, especially in yield per acre.

Estimates of acreage planted are based on census enumerations of 1925, 1930, and 1935, certain data from A.A.A. records for the years 1933-1937, inclusive, and current reports from a large corps of crop reporters relating to cotton acreage in each year.

The yield per acre estimates are based upon yields computed from acres and bales reported to the census in years of census enumeration and upon current reports from crop reporters relating to yield in each year.

Estimates of production are based upon county ginnings reported to the Bureau of the Census with adjustments made for cross-county movement of seed cotton ginned outside the county in which it was produced.

It was, of course, necessary to harmonize estimates of acreage planted and of yield per acre with estimated production in order to secure a series of data that would be consistent for both estimates of acreage and of yield per acre.

D. L. Floyd,  
Agricultural Statistician.
